

June 8, 2017

Christine Psyk, Director
Water Division, Office of Water and Watersheds
U.S. EPA Region 10
Attention: Chris Zell
1200 Sixth Avenue
Seattle, WA 98101

Dear Mrs. ~~Psyk~~^{Opalski}:

In accordance with 40 CFR 130.7 and Section 303(d)(1) of the Clean Water Act (CWA), the Washington State Department of Ecology (Ecology) submits the *Deschutes River, Percival Creek, and Budd Inlet Tributaries Multi-Parameter Total Maximum Daily Load (TMDL) Water Quality Improvement Report* for your review and approval. This TMDL addresses and establishes load allocations for temperature, fecal coliform bacteria, and fine sediment for your approval. ~~This letter replaces Ecology's December 17, 2015 submittal of the Deschutes River, Percival Creek, and Budd Inlet Tributaries Multi-Parameter Total Maximum Daily Load (TMDL) Water Quality Improvement Report. Impairments for dissolved oxygen and pH referenced in the December 17, 2015 submittal will be addressed as part of a broader nutrient reduction strategy issued as part of the Budd Inlet TMDL.~~

Commented [KA(1)]: Deleting this sentence. This was not our agreement.

Commented [KA(2)]: Moving discussion of pH and DO to the end.

The Deschutes River, Percival Creek, and Budd Inlet Tributaries Multi-parameter TMDL addresses 23 impaired segments on the 2014 Water Quality Assessment (303(d) list). The total number of TMDLs within this submission according to the 1996 counting convention is 18 (see Attachment A). ~~In addition to these listed segments, there are 6 water body segments found not meeting water quality standards. We ask that the load allocations applied to these water bodies also be approved.~~ The table in Attachment A clarifies and counts the water body segments addressed within this TMDL by showing their names and identification numbers.

Commented [KA(3)]: Math doesn't add up. The only way to get to 23 in the first sentence is to include the six category 2 listings. So I'm proposing to delete these sentences. If this is incorrect, please fix it.

Has anyone ever written down how the bean count works?

The Water Quality Improvement Report with Implementation Plan includes all the requirements and other information necessary to determine the statutory and regulatory adequacy of this TMDL. In addition, the public participation during the development of the TMDL is captured along with a responsiveness summary in Appendix F. You will find the report at: <https://fortress.wa.gov/ecy/publications/SummaryPages/1510012.html>.

The TMDL includes allocations and an implementation plan for the 23 impaired segments for which this letter seeks approval. ~~The Department of Ecology~~ will fully implement these allocations and proceed with all aspects of the implementation plan within the Deschutes River and Budd Inlet Tributaries watershed. Meeting the allocations and completing the implementation plan are required to return the Deschutes River to a healthy state and protect aquatic life and recreational uses. Among the most critical implementation actions are establishment of forested stream-side vegetation corridors and conservation of existing stream-side vegetation corridors on the Deschutes River and other streams. Establishing these stream-side vegetation corridors is required to make significant progress on problems related to temperature, fecal coliform bacteria,

and fine sediment. This will take a concerted effort on behalf of land owners, non-profit organizations, and governments in the watershed.

~~The Department of~~ Ecology augments the TMDL by clarifying the following two wasteload allocations for temperature to all permitted stormwater sources within the TMDL boundary.

1. All discharges shall not cause more than a 0.3°C increase in background stream temperature due to the combined effects of all human activities. That allowable 0.3°C increase is quantified using the following equation, which provides a numeric daily loading value to assess compliance with the allocation.

$$T_{eff} = T + 0.3 * \frac{Q + Q_{eff}}{Q_{eff}}$$

Where:

T = Background daily maximum temperature
Q = Daily average stream flow before discharge
Q_{eff} = Daily average stormwater discharge flow
T_{eff} = Temperature of allowable stormwater discharge

2. All discharges from stormwater systems shall not exceed T_{eff} calculated above and the numeric water quality standard found in WAC 173-201A of 17.5°C for the 7-DADMax.

In addition, ~~the Department of~~ Ecology clarifies the TMDL by expressing bacteria allocation in daily units (see Attachment B).

~~The Department of~~ Ecology is currently preparing a dissolved oxygen TMDL for Budd Inlet. The Budd Inlet TMDL will set nutrient load and wasteload allocations for all sources of nutrient pollution to the Inlet. Such allocations will include aggregated or distributed allocations to pollution sources within the Deschutes River watershed and other tributaries to the Inlet as needed to achieve ~~applicable riverine and~~ marine dissolved oxygen water quality standards. The Budd Inlet TMDL implementation plan will include nutrient reduction strategies that align with Puget Sound management objectives that target improved ecosystem health and attainment of water quality standards. More information on the Budd Inlet Dissolved Oxygen TMDL is available on our website at <http://www.ecy.wa.gov/programs/wq/tmdl/deschutes/BudiInletCapitolLkTMDL.html>. We will continue to work directly with EPA staff on the development of this TMDL. According to our current schedule, we plan to send a draft Budd Inlet TMDL to EPA for your full review by 20XX and send a completed TMDL for your approval by 20YY.

Impairments for dissolved oxygen and pH referenced in the December 17, 2015 submittal will be addressed by conducting the actions specified in the TMDL's implementation plan. as part of a broader nutrient reduction strategy issued as part of the Budd Inlet TMDL. The implementation plan addresses sources of pollution that affect five parameters: temperature, bacteria, fine sediment, dissolved oxygen, and pH. The TMDL implementation plan calls for actions to be completed by 2030. Compliance with numeric water quality standards will take longer since it takes time to achieve full mature riparian vegetation after it is planted. If the actions included in

the implementation plan are not met by 2030 or the river is not on target to meet standards after 2030, Ecology will submit an updated TMDL for the Deschutes River that addresses the failing parameters within five years.

I believe that the complete work outlined in the report meets the objectives of the CWA and will result in achieving water quality standards for temperature, fecal coliform bacteria, and fine sediment in the Deschutes River, Percival Creek, and Budd Inlet Tributaries. Your review and approval are greatly appreciated.

If you have questions or need clarification, please contact Andrew Kolosseus at andrew.kolosseus@ecy.wa.gov or (360) 407-7543.

Sincerely,

Heather R. Bartlett
Water Quality Program Manager
